

1. HUCK

AI Freight Negotiator

Vision + Data + Voice + Text in one dispatch workflow.

HUCK syncs freight listings, ranks loads against live fleet data, calls brokers with a voice AI agent, and summarizes every negotiation.

Next.js 16

React 19

InsForge

VAPI

Gemini

2. The Problem

Freight dispatch is still too manual.

Workflow	Today	Impact
Broker calls	One-by-one phone work	Slow throughput
Rate decisions	Gut feel vs. market	Margin leakage
Driver matching	Manual spreadsheet logic	Empty miles
Call notes	Incomplete records	No learning loop

**A dispatcher can only be on one call at a time. HUCK
can scale the loop.**

3. The Product

HUCK automates the full negotiation cycle:

- **Vision**: extract DAT screenshots into structured loads
- **Data**: compare posted rates against spot rates and driver fit
- **Voice**: call brokers through VAPI to accept, counter, or defer
- **Text**: summarize transcripts into outcomes, rates, and next steps

One click: rank, call, negotiate, log, and review.

4. How It Works

The rate engine decides the strategy. The voice agent executes it. The dashboard keeps the operator in control.

5. Status + Demo

Area	Status
Auth + backend	InsForge auth, Postgres, storage, API routes
UI	Unified dark emerald operations dashboard
Tables	TanStack-powered load, call, driver, vehicle views
Maps	Leaflet fleet/load map
AI	Gemini parsing and summaries, VAPI outbound calls

Demo flow:

Sign in → Sync fleet → Sync loads → Rank
